

GitHub Governed Deploy — MindShift Enforcement Spec

1. Purpose

This repository enforces a governed deployment model:

No production deploy may execute unless a valid, authority-bound execution object exists.

This replaces:

commit → deploy

With:

intent → Authority → AEO → Ω Validator → Execution Boundary → deploy → Proof

2. Core Invariant

If no valid object exists → nothing happens

A deployment is not “approved.”

A deployment is either:

VALID → may exist → may execute

NULL → does not exist → cannot execute

3. System Position

GitHub Actions is treated as an execution surface.

MindShift sits in front of it as the execution boundary.

GitHub deploy request

↓

MindShift boundary (Cloudflare Worker)

↓

VALID AEO required

↓

Workflow dispatch

↓

Proof-of-Transfer

If validation fails:

deploy = blocked (NULL)

4. Required Flow (Canonical)

POST /authority

POST /compile

POST /validate → VALID | NULL

POST /execute (only if VALID)

POST /proof

Authority → AEO → Ω Validator → Execution → Proof-of-Transfer

5. Authority Requirements

Every deploy must be backed by an ACTIVE authority object.

6. AEO

validated_object == executed_object

7. Validator

VALID | NULL only

8. Execution Boundary

Must be non-bypassable

9. Workflow

VALID → deploy

NULL → exit

10. Proof

No proof → execution incomplete

11. Authority Lifecycle

ACTIVE → CONSUMED → PERSISTED

12. Failure Modes

Missing authority, expired, replay, mutation → NULL

13. Security

Fail-closed, deterministic, traceable

14. Enforcement

No valid AEO → deployment does not exist

15. Final Principle

Deployments exist only if valid structure exists

16. Status

PARTIALLY ENFORCED → TARGET NON-BYPASSABLE
